: Has anyone seen anything in print about whether the vanity  
: callsign program (someday) might allow 1x1 calls?  
  
: (for info, a 1x1 is like K1X)

Well, I want \*my\* call to be "K".

Actually, international agreements and regulations do not  
allow a 1X1 format; 1X2, 2X1, 2X2, 1X3 or 2X3 only,

JY1 notwithstanding. :-).

Someone else we know might like ah6fu I don't think he can get enough  
spark from a tv set to justify a 1x1 call. The call is available as the  
last fellow could not handle it ;)

To: info-hams@ucsd.edu

For the pickers of nits out there, this was from a usershell at Netcom. Bottom line, the ftp server at <something>.std.com is indeed up and working. I guess if you've logged in with a "-" prefix to suppress the logon message you miss the details and only get the access denied comment. Also, it is entirely NORMAL to get access denied to anonymous users on most systems. After all the system IS there for the "real" users. Anonymous is a freebie for guests. Kind of like that "special" window at the bank for special customers. But sometimes (when there aren't any) they'll take the regulars.

Greetings...you'll have to excuse my lack of knowledge when it comes to using FTP procedures....haven't been at this long....using FTP I login to FUNE.FI, no problem there...once I find a .ZIP file I want I ask it to GET the file... again no problem, the program is sent to my local mainframe...I log off of the FTP address and go to the local mainframe and ask to send...I receive the file as a .ZIP but cannot UNZip it...I ALWAYS get "WARNING!" file fails CRC check or "has bad table"....on the local mainframe we have to use KERMIT to transfer files...or at least that is what I was told....like I said, I'm new at this so please excuse my lack of knowledge associated with using FTP procedures...I thank you in advance for any information I might receive. Oh ya, for those "few" of you who just can't resist jumping down my throat because I don't have a clue what I'm talking about....go play somewhere else...what I need is a little help not to be set on fire! 73s...Roger

Subject: KANSAS CITY TRACKER PROTOCOL  
To: info-hams@ucsd.edu

We are presently implementating an autotracking ground station for satellite work. We are using a German design tracking interface unit which we would like to implement with Instant Track. The drivers supplied with Instant track work with the Kansas City tracker board. I believe in a document called drv???.doc their is a complete description of the various registers etc. Does anyone have a copy of this document or any information that can be of use to us in writing TSR to interface with Instant track?

Thanks in advance.

best radio i have ever purchased! It goes with me from the house, to the car to the house, to the red cross truck to red cross national assignments back to the house. It's been dropped once or twice and doesn't seem to mind it.

It is also if memory serves me right, the only ham rig that is built to millitary specs.

I have had mine for a little over three years now and bought a yaesu ht because the 2400H worked out so well!

Uggghhhh..... I didn't realize I'd done that. :-) As they say, old habits never die....

> the early German PACTOR articles in QEX capitalised the entire word.  
> But, I have seen lots of people write it as PacTOR the way Jim  
> did.

I write it as PacTOR mainly because the documentation I've seen (I think it was the Kantronics documentation) wrote it that way. I'd assumed that this was the correct ``spelling''. I'd be interested in other opinions on this, too.
